

SecureFood

QUICK USER MANUAL

SecureFood Scenario Simulator

Navigate the Finland dairy supply chain scenario, run the policy-free default analysis, optionally test policy interventions, and download analysis-ready results.

Open case study

Run default scenario

Optional policy analysis

Download PDF and CSV

Scope

This guide covers only the SecureFood Scenario Simulator. It does not explain the wider GROCERYsim analysis, calibration, validation, or export workspaces.

Open the live application: finland.streamlit.app

1

Enter the SecureFood scenario

The shortest path from the public landing page to the dedicated scenario workspace.

1	Open the application Go to finland.streamlit.app . Select a language if needed.
2	Open the case studies Select Explore case studies on the landing page.
3	Choose Finland Find Finland - Dairy Supply Chain and select Launch simulation.
4	Open the scenario workspace Skip the guided tour if it appears, then select the green Scenario Simulator button.

What you will see

Page area	Purpose
Default scenario report	Fixed, policy-free climate-disruption preset with parameters shown in an expandable panel.
Default Scenario Analysis	Editable operational shock settings and a policy-free supply-chain simulation.
Additional Policy Analysis	Separate counterfactual module. It is off and hidden by default until explicitly enabled.

Fastest workflow: use the default preset

1	Review the preset Expand View preset parameters. The preset does not change when controls below are edited.
2	Generate Select Generate Default Scenario Report. The app runs the paired default conditions.
3	Download Choose the PDF report, Daily Results CSV, or Product Results CSV.

Key separation rule

The default report never includes a policy intervention. Enabling or editing the optional policy module does not alter the fixed default report.

2

Run an optional policy analysis

Use this module only when the stakeholder question concerns an intervention. It compares the selected policy against the same crisis without policy.

1

Open the policy tab

Select Additional Policy Analysis beside the default-analysis tab.

2

Enable the module

Tick Enable additional policy analysis. This reveals the counterfactual controls.

3

Define the shared crisis

Set crisis severity, logistics and inventory, and behavioural assumptions for the paired comparison.

4

Select at least one policy lever

The run and report buttons stay disabled until an intervention is active.

5

Generate policy outputs

Select Run Policy Simulation, review the results, then select Generate Report from This Analysis for the matching PDF and CSV package.

Available policy controls

Control group	Mechanisms available
Access and communication	Purchase rationing; government communication strategy; communication intensity.
Prices and affordability	Domestic, organic, or combined product subsidy; fat-content surcharge and threshold.
Information and preferences	Nutritional-labelling start day; health-preference and organic-preference boosts.
Counterfactual context	Crisis timing and duration, inflation, disruption, lead time, reorder/restock targets, panic, and hoarding.

What the comparison means

The policy report contains a paired crisis-without-policy condition and a selected-policy condition using the same seed. It does not replace the default scenario report.

Scientific caution

Panic, hoarding, communication, and labelling effects remain exploratory assumptions unless separately calibrated. Interpret differences as modelled counterfactuals, not validated causal estimates.

3

Download and interpret the results

Each report action produces a PDF and two CSV files from the same simulation conditions.

Download	Best use	Key contents
PDF Report	Presentation and review	Inputs, charts, paired comparisons, limitations, and methodological notes.
Daily Results CSV	Time-series analysis	One row per day and condition with aggregate revenue, inventory, welfare, access, panic, waste, and policy outcomes.
Product Results CSV	SKU/category analysis	One row per product, day, and condition. This file is larger and can take longer to prepare.

Scenario labels in the exports

Label	Meaning
Baseline	No crisis. Operational and welfare reference.
Crisis	Policy-free crisis used in the default scenario analysis.
Crisis (No Policy)	Counterfactual crisis inside the optional policy report, with all policy levers disabled.
Crisis (Selected Policy)	The same optional-policy crisis with the selected intervention configuration.

Choose the correct report button

Question	Button to use
Use the fixed stakeholder preset	Generate Default Scenario Report
Evaluate a selected policy against no policy	Run Policy Simulation, then Generate Report from This Analysis

Five-point live demo checklist

1. State whether the run is default or optional policy.
2. Show the included parameters.
3. Name the comparison conditions.
4. Keep unmet demand in units and check CSV column definitions.
5. Download the CSVs for reproducibility.

If the app is slow

Streamlit Community Cloud may temporarily throttle CPU. Wait for the page to finish loading, avoid repeated clicks, and generate one report at a time. Completed artifacts remain available in the current session.
