

QUICK USER MANUAL

SecureFood Scenario Simulator

Navigate the Finland dairy supply chain scenario, compare baseline and crisis conditions, generate preset or custom reports, and download analysis-ready results.

Open case study

Choose preset or
custom

Run scenario

Download PDF and CSV

Scope

This guide covers only the SecureFood Scenario Simulator. It does not explain the wider GROCERYsim analysis, calibration, validation, or export workspaces.

Open the live application: finland.streamlit.app

1 Enter the SecureFood scenario

The shortest path from the public landing page to the dedicated scenario workspace.

- 1 Open the application
Go to finland.streamlit.app. Select a language if needed.
- 2 Open the case studies
Select Explore case studies on the landing page.
- 3 Choose Finland
Find Finland - Dairy Supply Chain and select Launch simulation.
- 4 Open the scenario workspace
Skip the guided tour if it appears, then select Scenario Simulator.

What you will see

Page area	Purpose
Preset demonstration report	Fixed stakeholder demo with the included parameters shown in an expandable panel.
Supply Chain Actor tab	Operational settings, paired baseline vs. crisis results, inventory, revenue, waste, and unmet demand.
Policy Maker tab	Crisis settings, policy levers, welfare, equity, fulfilment, and import dependency.
Custom report from current settings	Fresh report using the current values from both tabs.

Fastest workflow: use the preset

- 1 Review the preset
Expand View preset parameters. These values remain fixed even if controls below are changed.
- 2 Generate
Select Generate Preset Demonstration Report. The app runs paired simulations and builds the artifacts.
- 3 Download
Choose the PDF report, Daily Results CSV, or Product Results CSV.

Important

The preset is intentionally independent of the controls in the two tabs. Use the custom report when you want changed values to affect the output.

Required next step after launching Finland

Launching Finland - Dairy Supply Chain opens the main GROCERYsim workspace; it does not yet open the dedicated SecureFood scenario. At the top of the workspace, find the SecureFood panel and click the green Scenario Simulator button. Only after this click will the preset report, actor and policy tabs, and custom report controls appear.

2 Build a custom SecureFood scenario

Change settings in either tab, then generate one report that captures the current configuration.

Start with the Supply Chain Actor tab for the operational shock, then use the Policy Maker tab for the policy comparison. The report reads the current values from both tabs.

Tab	Control group	What it changes
Supply Chain Actor	General	Duration, daily consumers, and start month.
Supply Chain Actor	Logistics	Lead time, reorder point, and restock target.
Supply Chain Actor	Climate Crisis	Crisis start, duration, price inflation, and supply disruption.
Supply Chain Actor	Consumer Behaviour	Exploratory panic sensitivity and maximum hoarding factor.
Policy Maker	Crisis Severity	Policy horizon, traffic, shock timing, inflation, and disruption.
Policy Maker	Consumer Behaviour	Panic, hoarding, month, and lead time.
Policy Maker	Policy Instruments	Purchase rationing, domestic subsidy, labelling, and communications.

Generate the custom report

1

Adjust the controls
Set the values needed for the stakeholder question in both tabs.

2

Optional on-screen runs
Use Run Supply Chain Simulation or Run Policy Simulation to inspect tab-specific charts. This is optional.

3

Review the report inputs
Expand Review current report parameters below the tabs and verify the summary.

4

Generate from current settings
Select Generate Report from Current Settings. The report runs fresh paired simulations; prior tab runs are not required.

No policy selected?

That is valid. The Policy Maker report will explicitly identify no active policy levers. The selected-policy comparison will therefore match the no-policy crisis condition.

Live demo tip

Change one or two inputs at a time and state the hypothesis before generating results. This keeps the comparison understandable and avoids presenting a bundle of simultaneous changes as one policy effect.

3

Download and interpret the results

Each report action produces a PDF and two CSV files from the same simulation conditions.

Download	Best use	Key contents
PDF Report	Presentation and review	Scenario inputs, charts, paired comparisons, limitations, and methodological notes.
Daily Results CSV	Time-series analysis	One row per day and condition, with aggregate revenue, inventory, welfare, access, panic, waste, and policy outcomes.
Product Results CSV	SKU and category analysis	One row per product, day, and condition. This file is larger and may take longer to download.

Comparison labels in the exports

Label	Meaning
Baseline	No crisis. Used as the operational and welfare reference.
Crisis	Crisis condition for the Supply Chain Actor perspective.
Crisis (No Policy)	Policy Maker crisis counterfactual with policy levers disabled.
Crisis (Selected Policy)	Same crisis with the selected policy configuration.
Crisis (No Active Policy)	Custom report label used when no policy lever is enabled.

Reading the outputs responsibly

Paired comparison The conditions use the same seed (42), so differences are easier to attribute to scenario settings. A single seed does not quantify simulation uncertainty.

Units matter Unmet demand / LostSales is measured in units, not euros. ImportDepPct is already a percentage. Check the column definition before aggregating or converting results.

Scientific boundary Treat panic, hoarding, communications, and labelling effects as exploratory scenario assumptions unless separately calibrated. Policy differences are model outputs, not validated causal estimates.

Five-point live demo checklist

Check	Before presenting
1	State whether the run is preset or custom.
2	Show the included parameters before showing results.
3	Name the comparison condition: baseline, no-policy crisis, or selected-policy crisis.
4	Use constant-price revenue for volume effects; keep unmet demand in units.
5	Download the CSVs so stakeholders can reproduce or extend the analysis.

If the app is slow Streamlit Community Cloud may temporarily throttle CPU. Wait for the page to finish loading, avoid repeated clicks, and generate one report at a time. Completed report artifacts remain available in the current session.
